

API Integration Guide

API Integration Process

1. Defining Schema Types in Sanity:

- Create `product.ts` and `category.ts` to define schema types.

2. Setting Up Sanity Project:

- Initialize a new Sanity project and obtain the API token with editor permissions.

3. Migration Process:

- Add a migration script.
- Define environment variables.
- Install required packages: `slugify`, `dotenv`, and `axios`.
- Run the command:

```
npm run import-data
```
- This will import data successfully, inshaAllah.

Adjustments Made to Schemas

- I want to build an e-commerce market where I want to add my own products so that I can easily launch it later.

That's why I have made my own schemas and imported my products.

Migration Steps and Tools Used

Tools:

- `dotenv` (for managing environment variables)
- `axios` (for making HTTP requests)

- slugify (for generating URL-friendly slugs)

Steps:

- Followed the steps mentioned in the API Integration Process section above.
